Authors: Dr. Shubhangi Kadoo, Dr. Pallav Patni, Dr. Pradeep Jain, Dr. Swadhin Raghuwanshi, Dr. Sonal Singh Arora, Dr. Sanket Hans Pandey, Dr. Katya Pandey.

CASE HISTORY: *A 26-year-old female patient reported to Department of Conservative Dentistry and Endodontics, with chief complaint of pain and discomfort in upper front tooth region from past 3-4 days. Medical history was non-significant. Cold vitality test was done with endo-frost which gave no response with maxillary left lateral incisor.*

DIAGNOSIS: *On radiographical examination, intraoperative periapical radiograph revealed of the left lateral incisor reveals an invagination extending from the crown to the root (Type II). Cone-beam computed tomography (CBCT) was done to evaluate the aberrant anatomy of the tooth which revealed an invagination extending from the crown to the root suggestive of type II dens-in-dente with the secondary symptomatic apical periodontitis.*

MANAGEMENT: The endodontic therapy was commenced with informed consent, followed by the sterilization protocol. The afflicted tooth was further locally anesthetized using a standard solution of lignocaine 2% with 1:200,000 adrenaline solution (Themicaine AD, Themis Medicare Ltd, Mumbai, India) and isolated with a rubber dam, and the procedure progressed uneventfully. A conventional type of an endodontic access cavity was created and the working length was determined (radiographic working length measured from an incisal edge to the root apex) and was confirmed using the apex locator (E-PEX PRO apex locator, Orikam Healthcare Ltd, Gurgaon, India). Biomechanical preparation was performed using Neoendo flex rotary files (Orikam Healthcare Ltd, Gurgaon, India) with the step-down technique. Cleaning and shaping were done til 20.06%, and irrigation was achieved with 2.5 mL of 5% sodium hypochlorite (Neelkanth, Jodhpur, India) using a 30-gauge side vented needle and normal saline. Then, the final irrigation was performed using 17% EDTA (Prevest Denpro, Jammu and Kashmir, India) followed by normal saline. Calcium hydroxide dressing were given in the intermediate appointments for 14 days. Master cone was accessed and the obturation was performed using an AH Plus sealer (Dentsply Sirona, Charlotte, USA) with an equivalent size of gutta-percha cones (Dentsply Sirona, Charlotte, USA). Composite resin (Filtek Z350, 3M ESPE, Seefeld, Germany) was used for post endodontic restoration of the tooth.
